

K6. INCLUSION OF WOMEN, MINORITIES, AND CHILDREN

The planned enrollment for the fellowship research proposal, including the number of women and racial/ethnic groups is shown in the Table K1. This is based on the proportion of patients that have already been enrolled in the Biobank study. It is expected that the recruitment pattern remains similar in regard to number of men and women of diverse racial/ethnic profiles. The planned analyses in this grant will attempt to identify subgroup analyses stratified by sex and race, but the power may be limited to detect differences. Nonetheless, these analyses will be performed. The parent studies did not include children (persons <18 years of age), as the aims of these studies were to examine the risk and outcomes in cardiovascular disease. Coronary artery disease rarely develops in persons <18 years of age, and due to this reason, they were not recruited for the parent studies.

Table K1. Demographics of expected enrollment

Racial/ethnic category	Male	Female	Total
Caucasian (white)	96	47	143
African American (black)	26	23	49
Other	6	2	8
Total	128	72	200
